
Identifying Interval Size

PRACTICE DRILL

Interval size is the space between two notes. When figuring out interval size, start counting from the first note. So for example, F to the same F would simply be 1. F to G (up a whole step) would have an interval size of 2. Go through each of these stacked notes and figure out their interval size. (We're not worrying about interval quality yet... major/minor/perfect/etc. Just the size!)
